

## PRESS RELEASE

RotaChock® – Tool Groove Design Initiative

Chock Design/Machinery Mounting Solutions advances machinery mounting technology once again by introducing the RotaChock® Tool Groove into all of its chocks that have adjusting holes.

The RotaChock® Design Teams improve the mechanical chocking industry again! 5 years ago our introduction of ACE processing improved the life cycle for steel chocking systems; 3 years ago our Slim Line Configuration eased mechanical chocking installations for tight configurations; and last year our Hex configuration chock brought mechanical chocking economics to lower horsepower rotating machinery.

Today we are proud to announce the next evolution for mechanical chocking: a Tool Groove.

A fundamental change to improve the mechanical chocking installation process and lifecycle adjustments.

For some installations, physical access to the adjusting holes are a challenge, especially outside of the construction building. Onboard tugboats or on the pipeline there are applications where finding the adjusting holes can be improved. An elegant solution is to design the chock with adjusting hole tool grooves that actually allows tools to find the adjusting hole.

### Try it!

The new Tool Groove design is innovative, simple, solutions oriented and now a standard for the RotaChock®.

Listening to feedback from our field teams, training leaders and end users we strive to improve mechanical chocking to help the installers and maintenance stakeholders. As a mechanical chocking innovator we engineer solutions to make the installation of the RotaChock® the easiest possible. Always fast, simple and repeatable for the lifecycle of the principal machines make the RotaChock® a leading technology for all types of aligned machinery where the mounting plane must be robust.

The new tool groove configuration will be phased-in through attrition of the current slotted adjusting holes stock levels.
