

## PRESS RELEASE

Machinery Mounting Solutions™ Introduces  
ACE

Anti- Corrosion Enhanced  
RotaChock™ Machinery Mounting Chocks

Machinery Mounting Solutions' latest innovation is leading heavy industry into more trouble-free installations. Introducing the ACE RotaChock assists the machinery mounting stakeholders with a rugged solution for rust problems. Driven by our solutions oriented philosophy we are implementing a new material process to our RotaChock products for owners, operators and fabricators of complex machine installations.

The RotaChock™ is a reusable machinery mounting chock for rigidly mounted machines. The RotaChock™ eliminates soft foot and is a proven success. The RotaChock has a large adjustment range which is coupled with a significant self leveling capacity for an easy to use chock that results in a high quality installation. The company's charter as a solutions provider understands and responds to the needs of our customers to address costs, technical needs and life cycle issues. While our stainless steel products

address the technical and life cycle concerns, the cost of the core material is not appealing for all applications. For most of the land based applications, the chocking system is exposed to the weather therefore plain ferrous based materials require maintenance. After thorough investigation and laboratory testing, Machinery Mounting Solutions™ has selected a process that diffuses the ferrite regional layer of carbon steel and alloy steel with carbon and nitrogen. The result is an enhanced rust resistance surface and improved wear attributes. Inherently the RotaChock™ is strong, stiff and the economical solution for the installation of machinery that requires coplanar mounting surfaces. Adding to our portfolio the ACE, Anti - Corrosion Enhanced, RotaChocks address the cost concerns of the marketplace for construction and maintenance. Contact Machinery Mounting Solutions™ for details.
